

# JustLanded for WordPress v1.1.x

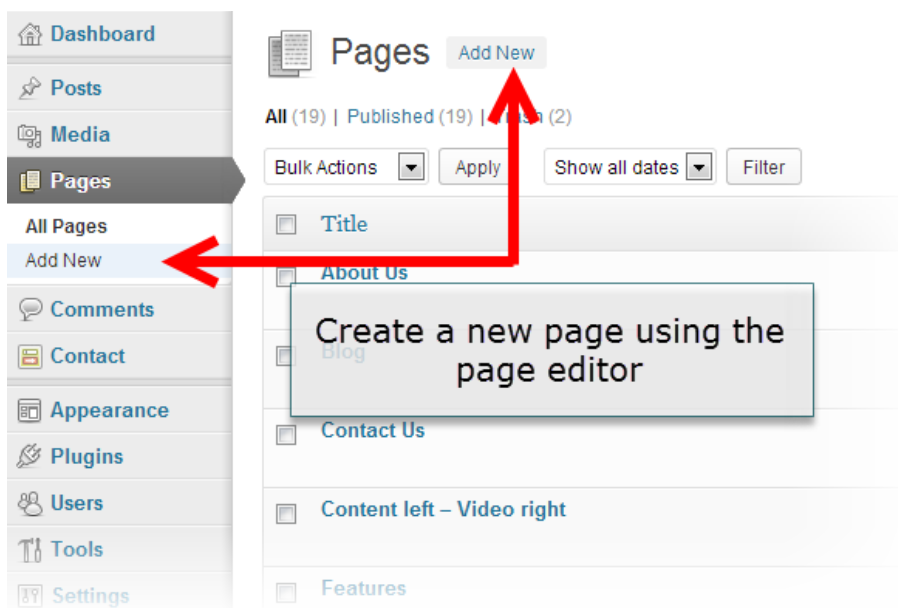

## Quick Guide: Multiple Landing Pages Using Settings Profiles

With JustLanded for WordPress you can create multiple landing pages with one installation of the theme. That way you can create variations of the same landing page for split-testing, or promote multiple products with one landing page for each product.

Each landing page can have its own header, banner and footer, use different colours, fonts and contents. In JustLanded for WordPress, this is facilitated through the use of settings profiles. Each profile contains a full set of site settings, including its contents.

This guide will explain how to create a new, separate landing page.

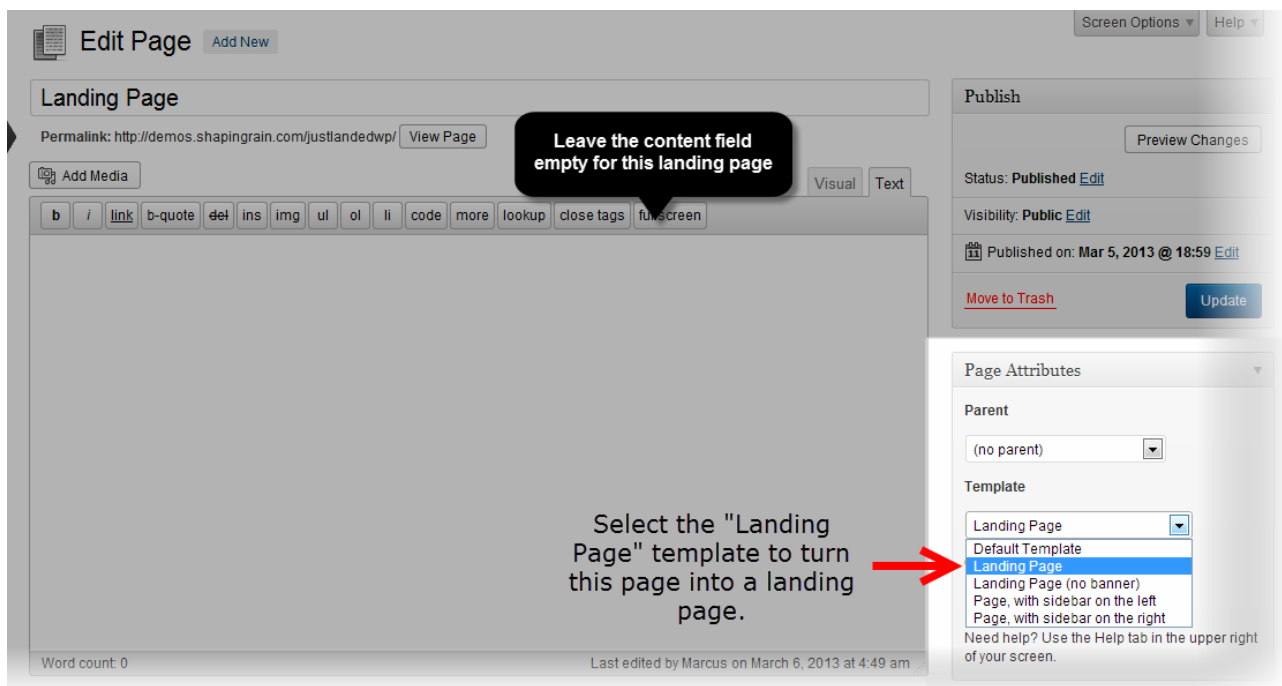

### 1. Create a new page.

### 2. Select the Landing Page template.

You can leave the large text area containing your content empty, as contents will be retrieved from the JustLanded options panel.

Selection of the 'Landing Page' template instructs the theme to display this page as a landing page.

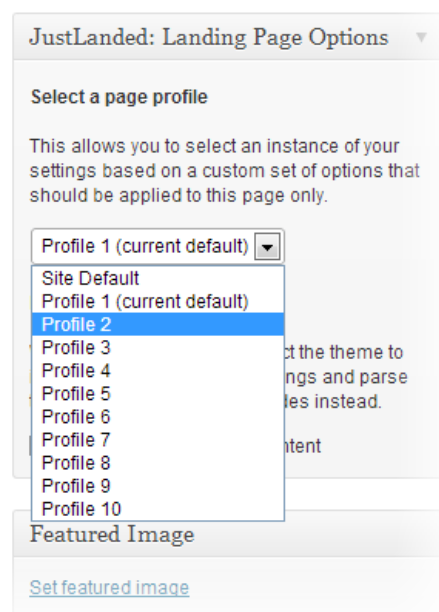

### 3. Select an unused profile.

Just underneath the "Page Attributes" box where you selected the template, the "Landing Page Options" box enables you to select a profile for this landing page.

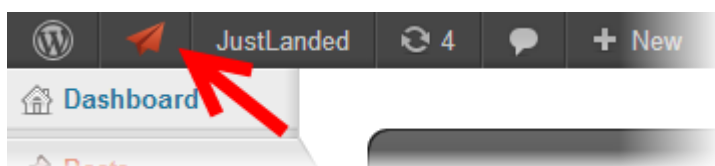

You can use any profile that is not currently in use by another page. If you started with a blank installation of JustLanded for WordPress, you can start with Profile 2.

If using the demo data, you might want to select profile 10, as it is not used by the demo pages.

Save and publish your new page.

### 4. Launch the JustLanded options panel.

## 5. Edit your new landing page.

You can now proceed and edit your landing page.

After launching the JustLanded options panel, use the profile selector at the very top to select the same profile you selected earlier when you created the page.

You can then proceed to edit any part of that landing page and how you would like it to be presented.

The screenshot shows the 'JustLanded for WordPress' theme options panel. At the top, there's a header with the theme name and version (v1.1.3). Below this is a profile selector dropdown menu currently set to 'Profile 1 (default)'. A red arrow points to this dropdown with a callout box that says: 'Use the profile selector to edit another profile.' To the right of the dropdown is a 'Save All Changes' button. Below the header is a sidebar menu with options like 'Home', 'Backup and Import', 'Profiles', 'Help and Support', 'General Settings', 'Fonts and Colors', 'Landing Layout', 'Banner', 'Action Buttons', 'Social Icons', 'Feature List', 'Gallery', and 'Testimonials'. The main content area is titled 'Site Default Profile' and lists 10 profiles, each with a radio button. 'Profile 1' is selected. A red arrow points to 'Profile 5' with a callout box that says: 'Make any profile the "Site Default Profile", which is used when no profile is explicitly assigned to a page.' Below this is a 'Profile Allocation Cheat Sheet' section, which lists pages and the profile they are assigned to. Under 'Profile 1', it lists: 'Demo Page (100)', 'Landing Page (390)', 'Power Shortcodes (169)', and 'Sample Page (2)'. A red arrow points to the 'Landing Page (390)' entry with a callout box that says: 'See at a glance which profile is used by what page.'

Save your changes when you are done. And remember to use the profile selector to switch to the appropriate profile the next time you would like to edit a landing page, as all settings will always be saved into the active profile only.
